**Abstract.** Two new species of *Lepanthes* from the Central Cordillera of the Colombian Andes are described and illustrated. Both were found during a botanical expedition to Puracé National Natural Park, within the high Andean forests ecosystem of the municipality of Puracé, in the department of Cauca.

**Resumen.** Dos nuevas especies de *Lepanthes* de la Cordillera Central de los Andes Colombianos se describen e ilustran. Ambas fueron encontradas en una expedición botánica al Parque Nacional Natural Puracé, en Bosques Altoandinos en el municipio de Puracé en el departamento del Cauca.

**Key Words:** Cauca, Colombian Massif, Kokonukos, Paletará, Puracé National Natural Park

**Introduction.** The National Natural Park (PNN) Puracé and its buffer zone cover areas of Andean, high–Andean forest, and paramo ecosystems in the Colombian Massif of southwestern Colombia. This PNN is located in the southern sector of the Central Cordillera between the departments of Cauca and Huila, it has an extension of 91,483 ha with an elevation range between 2350 and 5000 m a.s.l. (Bonilla-Valencia et al. 2019). In the northwestern of PNN Puracé, the buffer zone si inhabited by the Kokonukos indigenous community, distributed in the Resguardo of Kokonuko, Puracé, and Paletará, occupying approximately 15,630 ha in the western slope of Cordillera Central, municipality of Puracé, central-eastern area of the Cauca department (Fig. 1) (Bravo 2012). This indigenous community recognizes the vital importance of biodiversity conservation since the geographical sites are intimately linked to its worldview and especially the ancestral medical system, describing their natural territory like the land of “Jucas” that corresponds to an ancestral power of the underground world where water dominates (Faust 1991, 2004).

Given its location, this area occupies a unique position to study the high Andean flora diversity, but this information is scarce and scattered with limited scientific publications (Rangel-Ch & Lozano-D 1986, Duque & Rangel-Ch 1989, Duque & Restrepo 1992, Alzate 2007, Hágsater & Santiago 2015, Abud & Torres 2016, Hágsater, Santiago & Uribe Vélez 2018, Bonilla-Valencia et al. 2019). Here, contributing to the knowledge of the flora in this important area, we describe and illustrate two new *Lepanthes* Sw. species found within the Kokonukos indigenous territories in the Cauca department of Colombia. The new species were found during a botanical expedition between December 2019 and February 2020, within and in surrounding areas of the Puracé PNN.

**Materials and methods**

*Descriptions and drawings.*— The descriptions and drawings were prepared from living specimens. Specimens were dissected under an AmScope SM-1TNZ-144A-3M stereo microscope and preserved in alcohol. Digital images were taken with a Nikon D750 with a Nikkor 105 mm f/1.8 macro lens. Sketches from living and preserved specimens were digitized, and the images were used for diagramming a draft composite template in Adobe Photoshop® CS6. Then, a digital composite line drawing was made (lines and stippling) in Procreate illustration application for iPad 6th generation tablet computer (Bogarín et al. 2019).
Plant material.— Lepanthes specimens in the following herbaria AMES, CAUP, ICESI, JAUM, HPUJ, HUA, FMB, VALLE, JBB, CUVC, SEL, MO (online), TOLI and COL (online) were consulted, but no additional material was found there for us to include in the description of the new species.

Taxonomic treatment

Lepanthes kokonuko J.S.Moreno & Pisso-Florez, sp. nov. (Fig. 2–3, 6A).

Diagnosis: Lepanthes kokonuko is most similar to Lepanthes guanacasensis Luer & R. Escobar, but it can be distinguished by its strongly ovate revolute lateral sepals (vs. ovate, non-revolute), its transversely bilobed petals with the upper lobe lanceolate (vs. oblong) and a bilaminate lip with the blades microscopically pubescent (vs. essentially glabrous) and a bipartite appendix with two linear clavate processes (vs. ovoid appendix minutely bilobulate at the apex).

Plant epiphytic, medium in size, caespitose, erect to suberect, up to 11.5 cm tall. Roots slender, flexuous, filiform, ca. 1 mm in diameter. Ramicauls slender, erect to suberect, stout, up to 8 cm long, enclosed by 2–6 lepanthiform sheaths, furrowed, microscopically ciliate along the margins, with a dilated ostia, acuminate. Leaves erect, coriaceous, elliptical, acute, the apex emarginate with an abaxial apiculum in the middle, 1.5–3.5 × 1.0–1.5 cm, the base cuneate contracted into a petiole 4–6 mm long. Inflorescence 2–3 congested, successively few-flowered racemes up to 7 cm long including the peduncle, loose, distichous, flexuous positioned below the leaf by a filiform peduncle up to 2.5 cm long; floral bract deltoid, acute, 1.5–3.6 mm long; pedicel terete, persistent, 3–4 mm long. Ovary with 3 fringed wings, costate, 1.0–1.3 mm long. Flowers with sepals light yellow, the lateral medially suffused...

with burgundy, petals yellow with the upper lobes suffused with burgundy towards the base and orange along the margins, lip saffron marginally suffused with orange, the base of the blades crimson, column white, anther cap pink. Sepals similar in shape and size, ovate, attenuate, carinate abaxially along the veins. Dorsal sepal 3-veined, slightly concave, 1.0–1.3 × 0.3 cm, connate to the lateral sepals for 2 mm. Lateral sepals 2-veined, strongly revolute in natural position, 1.0 × 0.4 cm, connate for 6 mm. Petals microscopically pubescent, transversely bilobed, with a small, marginal angle between the lobes, 1.0 × 0.4 cm, connate to the base of the column, the sinus broad with a bipartite appendix composed of two linear, clavate processes. Column terete, 1.5 mm long, the anther dorsal and the stigma apical. Anther cap orbicular to cordate, cucullate, 0.25 mm wide. Pollinia yellow, two, pyriform, 0.3 mm long.

Etymology: The name Kokonuko, which means “Mountain people”, refers to the Kokonukos indigenous community that inhabit the area where the species was found. Also, in reference to the Kokonukos volcanic chain, a sacred place protected by the Puracé National Natural Park and its local communities.

Distribution and Ecology: Lepanthes kokonuko is found in the Colombian Massif of the western slope in Central Andes at Piedra León village in the municipality of Sotará and Rio Negro village in the municipality of Puracé, both in the Cauca department, between 3172–3235 m in elevation (Fig. 4). It has been found growing as an epiphyte next to Lepanthes cyrtostele Luer & Hirtz, Lepanthes mucronata Lindl., and Lepanthes arbuscula Luer & R.Escobar, in a high Andean forest (Fig. 5) with arboreal species like Clusia multiflora Kunth and Weinmannia pubescens Kunth. We observed this species flowering during our visits (December to February), typically dry seasons in that region.

Lepanthes kokonuko can be easily recognized by its caespitose medium size plants, elliptical coriaceous leaves, long loosely, flexuous and distichous inflorescences; strongly revolute lateral sepals, transversely bilobed petals with the upper lobe lanceolate (hornlike), and a bilaminate lip with the blades ovoid–lanceolate with a bipartite appendix. It is probably related to the other racemose species Lepanthes biloba Luer & R.Escobar, Lepanthes guanacasensis Luer & R.Escobar, Lepanthes muscula Luer & R.Escobar and Lepanthes osiris Luer & R.Escobar (Luer & Thoerle 2012). The most similar species is undoubtedly Lepanthes guanacasensis (Fig. 6B), characterized also by its long loosely and flexuous inflorescences like L. kokonuko, ovate dorsal and lateral sepals (vs. strongly revolute lateral sepals) transversely bilobed petals with the upper lobe oblong [vs. lanceolate (hornlike)] longer than the lower lobe and an ovoid appendix, minutely bilobulate at the apex (vs. bipartite with two linear clavate processes). Lepanthes osiris is also similar but it has ovate lateral sepals (vs. strongly revolute lateral sepals), narrowly ovate, subequal petals (vs. upper lobe longer than the lower, the upper lobe lanceolate and the lower lobe triangular) and a lip with a small, oblong, bifid appendix (vs. bipartite with two linear clavate processes). Finally, Lepanthes biloba and Lepanthes muscula have a bilaminlate lip with the blades elliptical or ovate, convex in L. biloba and blades oblong in L. muscula (vs. ovate-lanceolate), and both having an orbicular appendix with a pair of rounded terminal lobules (vs. bipartite with two linear clavate processes).

Lepanthes jucas J.S.Moreno & S.Vieira-UrIBE, sp. nov. (Fig. 7–8, 9D).

Diagnosis: Lepanthes jucas is similar to Lepanthes cornualis Luer & R.Escobar, but can be easily distinguished by its elliptical–lanceolate leaves (vs. narrowly elliptical); strongly papillose petals (vs. minutely pubescent, shortly papillose), transversely bilobed with falcate, triangular lobes (vs. lobes narrowly triangular) and bilaminate lip with the blades

hispid, obovate to oblong with an ovate appendix (vs. narrowly obovate blades and a minute bilobed appendix).

*Plant* epiphytic, caespitose, suberect, up to 7.5 cm tall. *Roots* slender, 0.5 mm in diameter. *Ramicauls* slender, erect to suberect, stout, 2.8–4.2 cm long, enclosed by 5–8 lepanthiform sheaths, furrowed, with a dilated ostia, acuminate. *Leaves* erect, coriaceous, elliptical, with slightly revolute margins of the blade, acute, the apex emarginate with an abaxial apiculum in the middle, 2.8–3.2 × 0.5–0.8 cm, the base cuneate contracted into a petiole 3–4 mm long. *Inflorescence* subcongested, 1–2 successively flowered racemes up to 2 cm long including the peduncle, loose, distichous, flexuous, positioned below the leaf by a filiform peduncle up to 1 cm long; floral bract, acute, 1.0–1.3 mm long; pedicel terete, persistent, 3 mm long. *Ovary* costate, trialate, with 3 fringed wings, 2 lateral and 1 dorsal, 2 mm long. *Flowers* with sepals vinaceous, petals scarlet, lip peach, column scarlet, anther cap pink. *Sepals* similar in shape and size, ovate, ovate, minutely denticulate, attenuate to acuminate, carinate on the abaxial surface along the veins. *Dorsal sepal* 3-veined, concave, 6.0 × 3.8–4.0 mm, connate to the lateral sepals for 1.5 mm. *Lateral sepals* 1-veined, oblique, 5.8–6.0 × 4.5 mm, connate for 3 mm. *Petals* falcate, strongly papillose, transversely bilobed, 1.0–1.3 × 3.8–4.0 mm, the lobes triangular, oblique, obtuse, the upper lobe wider than the lower lobe. *Lip* bilaminar, the blades hispid, obovate to oblong, with rounded ends, 2.5 × 1.0 mm long, the connectives short, cuneate, puberulous, the body connate to the base of the column, the sinus obtuse, with an ovate, pubescent appendix. *Column* terete, slender, 2.5 mm long, the anther dorsal and the stigma apical. *Anther cap* cordate, cucullate, 0.5 mm wide. *Pollinia* yellow, two, pyriform, 0.5 mm long.

**Additional material examined:** COLOMBIA. Valle del Cauca: Municipality of Cali, PNN Farallones.

**ETYMOLOGY:** The specific epithet *Jucas* represents, for the Kokonukos indigenous communities, an ancestral energy of the underground world where the water dominates. *Jucas* also means all the native plants, animals and the spirits of nature, even the spirits that cause “mal viento” (cold wind) producing weakness in children and pregnant women. The following description was published by Faust (2004) which states: “From *Jucas* is the virgin land, the water and all places rich in water as the lagoons, rivers, swamps, primary forests, hills and mountains that “gushes” out water, and even the volcanos that according to the indigenous people of the Colombian Massif, when are snowy “gushes” ice”.

**DISTRIBUTION AND ECOLOGY:** *Lepanthes jucas* was found growing next to *Lepanthes caudata* Luer & R. Escobar, in the Colombian Massif of the western slope of the Central Andes on the road between Paletará and San José de Isnos municipalities in the departments of Cauca and Huila, respectively. It has been found on the edge of an open road surrounded by a High Andean Forest Ecosystem within the Puracé National Natural Park. The new species is possibly distributed all along the open road to Huila department where the ecosystem ends (Fig. 4).

*Lepanthes jucas* belongs to the section *Lepanthes* subsection *Breves*, characterized by having one single vein in the lateral sepals (Luer & Thoerle 2012). It can be recognized by its caespitose plants with elliptical–lanceolate leaves, short inflorescences and dark vinaceous flowers with striking papillose transversely bilobed petals and a bilaminate lip with hispid blades. Three species from the subsection *Breves* share similar traits with *Lepanthes jucas*. *Lepanthes cornualis* Luer & R. Escobar, *Lepanthes cyrtostele* Luer & Hirtz (Fig. 9) (Luer 1996), and *Lepanthes monoptera* Lindl. All of these species might belong to an informal group of species confined to wet and mossy high Andean forests, paramo and subparamo ecosystems from the Andes. The most similar species is *Lepanthes cornualis*, but it can be distinguished by its petals narrowly triangular, minutely pubescent and shortly papillose along the margins (vs. falcate, triangular, entire, and strongly papillose), the lip blades narrowly obovate, ciliate with the apices recurved (hornlike) and a minute bilobed appendix (vs. lip blades obovate to oblong, hispid with the apices rounded and an ovate appendix).

These two new species that honor the ancient territories of the Kokonokus indigenous communities within the PNN Puracé and its surroundings are part of a contribution to recognize the native indigenous population in Colombia, its worldview, and its territories. *Lepanthes kokonuko* and *L. jucas* are distributed on territories where the forests are still pristine, with numerous lagoons, swamps, volcanos, and surrounded by different paramos that produce big

amounts of water for the human being in Colombia. The ancient territories must be protected all along the country, and conservation efforts must be carried out involving local people to be immersed in biodiversity and conservation actions.

ACKNOWLEDGMENTS. We are grateful with the support of Parques Nacionales Naturales de Colombia and Parque Nacional Natural Puracé, specifically, the chief Isaac Bedoya, who motivated us to develop this research through the contract 087 - 04 February 2020, to contribute to the knowledge of the biodiversity of this protected area; and the park ranger Diomar Castro Fierro and son for joining us. To Salomón Avirama and Edgar Pizo, for protecting these high Andean forests where the species were found and for letting us explore their territories. Finally, we thank Kanchi Gandhi from the AMES herbarium at Harvard, for his kind help with the etymologies of the names; to Eugenio Restrepo, for his comments regarding the identity of these new species; to Ron Parsons, who let us use the photograph of Lepanthes cornualis. Finally, to Diego Miguel Garcés, who was very kind in contributing his picture of the volcanic chain of the Kokonukos.
